1. SUBCELLULAR LOCATION: Membrane-bound (Potential).

1. DEVELOPMENTAL REGULATION ONLY OCCURS IN BRAIN OF MID-METAMORPHOSIC TO POST-METAMORPHOSIC TADPOLES AN BRAIN OF MID-METAMORPHOSIC TO POST-METAMORPHOSIC TADPOLES ANDULTS, WHERE AN INCREASE OF SEVERAL FOLD HAS BEEN OBSERVED.

1. SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 1 (BH1) DOMAIN.

1. SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 2 (BH2) DOMAIN.

1. SIMILARITY: BELONGS TO THE BCL-2 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                "Cloning, characterization and expression of cell-survival genes.";

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DB seq length: 0

transforming protein bcl-2; splice form beta - human
N.Alternate names: apoptosis regulator bcl-2
C.Species: Homo sapiens (man)
C.Date: 31-Dec-1988 #sequence_revision 31-Dec-1988 #text_change 15-Oct-1999
C.Accession: B29409; I52566; D37332
R.Tsujimoto, Y.; Croce, C.M.
Proc. Natl. Acad. Sci. U.S.A. 83, 5214-5218, 1986
A.Title: Analysis of the structure, transcripts, and protein products of bcl
A.Reference number: A29409; MUID:86259760; PMID:3523487
A.Accession: B29409
A; Molecule type: mRNA
A; Residues: 1-205 <TSU>

The Bok protein and transgenic animal are also useful for identifying ligands or substrates. Modulation of the gene activity in vivo is useful for prophylaxis and therapy of, e.g. cancer and other proliferative disorders. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic protein with wide tissue distribution and heterodimerisation properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 protein, of the invention. Coding sequences for Bok or BH3i variants of pro-approtic Bok-related protein can be introduced into cell populations to upregulate expression of the proteins in order to induce approtosis in the cell population. This is useful for treatment of diseases where there is hyperproliferation of reproductive tissue, e.g. uterine, testicular and ovarian carcinomas, endometricosis, squamous and glandular epithelial carcinomas of the cervix. Cell killing induced by Bok can be suppressed by co-expression with selective anti-approtoic Bol-2 proteins. The Bok protein and be suppressed by co-expression with selective anti-approtoic Bol-2 proteins. The Bok

Cell killing induced by Bok can be suppressed by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok protein can be used to elucidate apoptosis mechanisms in reproductive an other tissues, and provide a means for manipulating apoptosis. The Bok protein and transgenic animal are also useful for identifying ligands or substrates. Modulation of the gene activity in vivo is useful for prophylaxis and therapy of, e.g. cancer and other proliferative disorders. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic protein with wide tissue distribution and heterodimerisation properties

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence is a mammalian Bok (Bcl-2-related ovarian killer) protein, of the invention. Coding sequences for Bok or BH3i variants of pro-apoptotic Bok-related protein be introduced into cell populations to upregulate expression of the proteins in order to induce apoptosis in the cell population. This is useful for treatment of diseases where there is hyperproliferation of reproductive tissue, e.g. uterine, testicular
                                                                                                                                                                     Rattus rattus

CC protein, of the invention. Coding sequences for Bok or BH3i variants of protein can be introduced into cell populations
CC to upregulate expression of the proteins in order to induce apoptosis in CC the cell population. This is useful for treatment of diseases where there CC is hyperproliferation of reproductive tissue, e.g. uterine, testicular cardinomas, endometriosis, squamous and glandular epithelial cardinomas of the cervix. Cell killing induced by Bok can be suppressed CC by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok CC protein can be used to elucidate apoptosis mechanisms in reproductive and CC other tissues, and provide a means for manipulating apoptosis. The Bok CC protein and transgenic animal are also useful for identifying ligands or CC substrates. Modulation of the gene activity in vivo is useful for CC prophylaxis and therapy of, e.g. cancer and other proliferative CC disorders. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic protein control of the control of apoptosis mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                     Вb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence is a mammalian Bok (BCl-2-related ovarian killer)
CC protein, of the invention. Coding sequences for Bok or BH3i variants of protein, of the invention. Coding sequences for Bok or BH3i variants of protein can be introduced into cell populations to upregulate expression of the proteins in order to induce apoptosis in the cell population. This is useful for treatment of diseases where there is hyperproliferation of reproductive tissue, e.g. uterine, testicular and ovarian carcinomas, endometriosis, squamous and glandular epithelial carcinomas of the cervix. Cell killing induced by Bok can be suppressed by co-expression with selective anti-apoptotic Bcl-2 proteins: The Bok protein can be used to elucidate apoptosis mechanisms in reproductive and other tissues, and provide a means for manipulating apoptosis. The Bok protein and transgenic animal are also useful for identifying ligands or substrates. Modulation of the gene activity in vivo is useful for substrates. Modulation of the gene activity in vivo is useful type based on expression. Identification of Bok as a new pro-apoptotic protein with vide tissue distribution and heterodimerisation properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

Human ORFX ORF1208 polypeptide sequence SEQ

ID NO:2416.

```
CC AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, CC which represent the human ORFX open reading frames 1 to 3161. The ORFX CC sequences have activities such as: cytostatic; hepatotropic; vulnerary; CC antipsoriatic; antiparkinsonian; nootropic; neuroprotective; conteopathic; anticonvulsant; antiarthritic; immunosuppressant; thrombolytic; coagulant; vasotropic; CC antidiabetic; hypotensive; dermatological; immunosuppressive; cc antitinflammatory; antibacterial; antiviral; antifungal; antirheumatic; CC antitinflammatory; antibacterial; antiviral; antifungal; antirheumatic; CC antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating cc the presence of or predisposition to, or preventing or treating cc pathological conditions associated with an ORFX-associated disorder. The cnucleic acids can be used to express ORFX proteins in gene therapy cc vectors. The proteins and nucleic acids may be used to treat cancers, craditorascular disease, diabetes mellitus, cc proliferative disorders, neurodegenerative disorders, osteoarthritis, cc proliferative disorders, neurodegenerative disorders, osteoarthritis, cc proliferative disorders, cardiovascular disease, diabetes mellitus. Cc erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, concernial or fungal infection, malaria, autoimmune disorders, asthma, cc concernial themoglobinuria, antiinflammatory disease; to enhance concerniation, antiinflammatory disease; to enhance

                                                                           The invention provides nucleic acid molecules (NAM1) encoding 4 human CC Bc1-2-like polypeptides (PEP1). The NAM1 and PEP1 may be used in the CC prevention, diagnosis and treatment of diseases associated with CC inappropriate Bc1-2-like polypeptides' expression. The NAM1 may be used CC inappropriate Bc1-2-like polypeptides by standard recombinant CC methodolgy. The polypeptides may also be used as antigens in the CC production of antibodies against Bc1-2 and in assays to identify CC modulators of Bc1-2 expression and activity. The anti-Bc1-2 antibodies and anti-PEP1 antibodies may be used to down regulate expression and activity. CC and anti-PEP1 antibodies may also be used as diagnostic agents for CC detecting the presence of Bc1-2 polyps in samples (e.g. by enzyme linked CC immunosorbant assay (ELISA)). Disorders that may be prevented, diagnosed CC and/or treated by the above methods include, inmunodeficienceles (e.g. activities and B cell lymphoproliferative disorder), autoimmune CC disorders (e.g. rheumatoid arthritis and Grave's disease), allergic
                                                  reactions, inflammations, respiratory diseases and cardiovascular disorders (a full list of disorders is given in the specification
                                                                                                                                                                                                                                                                                                                                                                    Claim 12;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       B
                                           antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antiborterial; antifungal; antiparasitic and cardiant activity. The polynucleotide and protein sequences are used in the diagnosis of cancer, particularly breast and ovarian cancer. The nucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment of immune disorders e.g. Addison's disease, altergies, autoimmune to firmune disorders e.g. Addison's disease, altergies, autoimmune disorders e.g. Addison's disease, altergies, autoimmune chyricianterial acidence the providities.
                                                                                                                                                                                       invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive; noottopic; neuroprotective; antiviral; antiallergic; hepatotropic;
                                                                                                                                                                                                                                           Sequences AAF21614 - AAF22031 represent DNA sequences encoding human proteins AAF38711 - AAF39128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention are sequences AAF22032 - AAF22040 and AAF39129 which are used in the isolation and characterisation of the DNA and protein sequences of the
                                                                                                                                                                                                                                                                                                                                                                                                   New human breast and ovarian cancer associated gene sequences and the polypeptides encoded by these genes, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Homo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ij
                                                                                                                                                                  The present sequence is human BCL2 from which a peptide capable of inhibiting BCL2 gene, or gene product, function in a cell can be derived. The cDNA sequence encoding the peptide is a sense oriented genetic suppressor element (GSE) for reversing.
                                                                      for the treatment of cancer, but more generally to induce virus infected cell death, or to treat apoptosis related diseases of haematopoietic or neurological cells. The GSE peptide product or
                                                                                                                       GSE and its peptide product can be used to sensitise cancer cells to chemotherapeutic agents, and to increase apoptosis, especially

                                                                                                                                                                                                                                                                                                                                                                                                                     increased apoptosis inhibitory activity compared with the wild type Bc1-2 protein. The mutated Bc1-2 protein is useful in the treatment of disorders caused by apoptosis. The present sequence is a mutant Bc1-2 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an apoptosis inhibitor comprising the amino acid sequence of Bcl-2 protein in which at least one serine residue is substituted by alanine or aspartic acid. The protein has

The mutated Bcl-2 of disorders caused by apoptosis. Bcl-2 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an apoptosis inhibitor comprising the amino acid sequence of Bc1-2 protein in which at least one serine residue is substituted by alanine or aspartic acid. The protein has increased apoptosis inhibitory activity compared with the wild type Bc1-2 protein. The mutated Bc1-2 protein is useful in the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New apoptosis inhibitors, disorders

Antisense oligonucleotides have been designed to bind sites in mRNA transcribed from the bcl-2 gene, thereby reducing expression of the bcl-2 protein and inducing cell death in certain cancer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Anti-code oligomers which bind to bcl-2 mRNA - for the treatment of human solid tumours, esp. breast cancer {\sf var}
